

# Projects to Protect Salmonids from Toxic Tire Dust

Katie Holzer, City of Gresham

Roy Iwai, Multnomah County

Neil Schulman, North Clackamas Urban Watersheds Council

# Overview

1. Introduction to toxic tire dust (6PPD-Q)
2. Relevance to Oregon's aquatic species
3. Implications for PFA Grantees

# 1. Introduction to Toxic Tire Dust (a.k.a. 6PPD-Q)

- Salmon die-off events observed starting in early 2000's

Coho spawner mortality is widespread and recurrent in urban creeks

67%

Longfellow Creek 2003

63%

Des Moines Creek 2004

72%

Longfellow Creek 2005

84%

Longfellow Creek 2012

## Recurrent Die-Offs of Adult Coho Salmon Returning to Spawn in Puget Sound Lowland Urban Streams

# Narrowing it Down

Urban stormwater runoff

-> tires

-> specific tire chemical (6PPD-Q)

# Sources of Toxic Tire Dust

- Major source: Runoff from high traffic roads which drain to streams

# Lethality of Toxic Tire Dust

- Second most toxic compound ever tested (after DDT)
- Highly toxic to coho salmon:  $LC_{50} = 40-95 \text{ ng/L}$
- Disrupts the blood-brain barrier

**Runoff (& 6PPD-quinone) disrupts blood-brain barrier**

Tracer dye injected into heart; rinsed out after 5 min

Runoff

Tracer dye leaked into brain

Jen McIntyre

fish in clean water

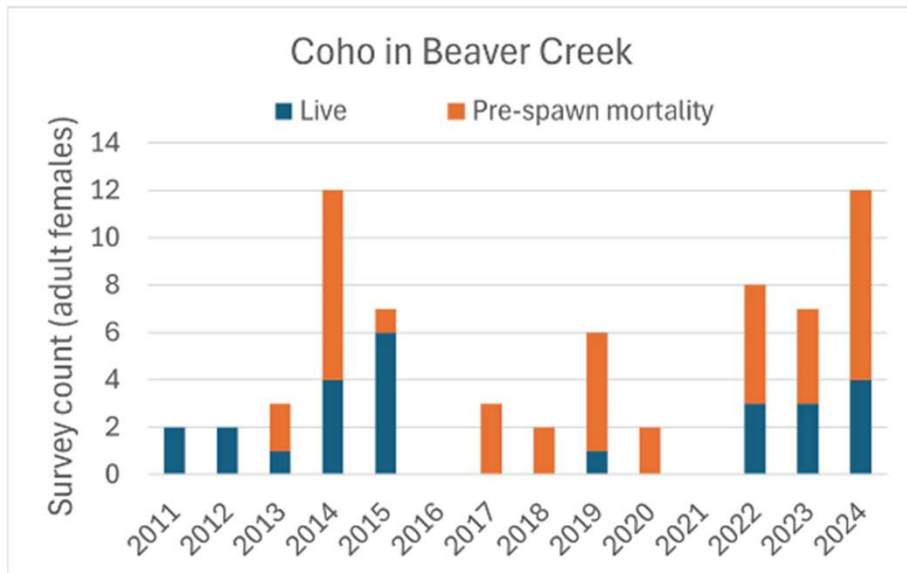

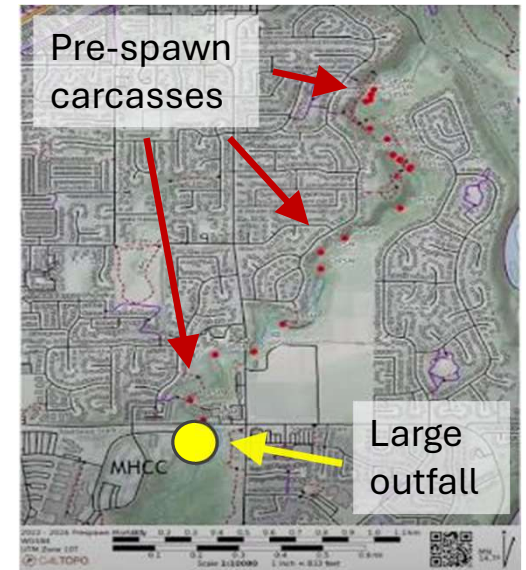

# Oregon 6PPD-Q Data

- Present wherever road runoff reaches streams
- Lethal levels near outfalls

# Beaver Creek Example

- Fish passage and stream restoration projects
- Coho returning, but many dying pre-spawn
- All pre-spawn death downstream of large outfall with high 6PPD-Q
- Could retrofit outfall and/or contributing roads

# Treatment

- Typical stormwater treatment generally works well!
  - Sorbs to organic matter
  - Bioretention, rain gardens, porous pavement, tree wells
- Infiltration is best
- Filter with organic material
  - Compost, biochar, soil, coconut coir, etc.

# Importance of Addressing this Issue

- Fish passage and stream restoration projects can only be effective if the fish aren't poisoned

## 2. Relevance to Oregon's Aquatic Species

- Chemical still relatively new, but testing has been conducted on some aquatic species, several of which are in Oregon

# Fish Species Tested for 6PPD-Q Lethality

Species	LC <sub>50</sub> (µg/L)
Coho salmon ( <i>Oncorhynchus kisutch</i> )	0.04, <sup>24</sup> 0.08, <sup>25</sup> 0.095 <sup>2</sup>
White-spotted char ( <i>Salvelinus leucomaenis pluvius</i> )	0.51 <sup>26</sup>
Brook trout ( <i>Salvelinus fontinalis</i> )	0.59 <sup>3</sup>
Rainbow trout/steelhead ( <i>Oncorhynchus mykiss</i> )	0.64, <sup>29</sup> 1.0, <sup>3</sup> 2.26 <sup>5</sup>
Chinook salmon ( <i>Oncorhynchus tshawytscha</i> )	67.3 <sup>24</sup> , 82.1 <sup>25</sup>
Sockeye salmon ( <i>Oncorhynchus nerka</i> )	Not acutely toxic at 50 <sup>25</sup>
Atlantic salmon ( <i>Salmo salar</i> )	Not acutely toxic at 12.2 <sup>28</sup>
Brown trout ( <i>Salmo trutta</i> )	Not acutely toxic at 12.2 <sup>28</sup>
Arctic char ( <i>Salvelinus alpinus</i> )	Not acutely toxic at 12.7 <sup>3</sup>
Southern Dolly Varden ( <i>Salvelinus curilus</i> )	Not acutely toxic at 3.8 <sup>26</sup>
Cherry salmon ( <i>Oncorhynchus masou masou</i> )	Not acutely toxic at 3.5 <sup>26</sup>

\*Coastal cutthroat trout (*Oncorhynchus clarkii clarkii*)

\*Likely similar to Coho  
(publication coming soon)

# Covered Species

- Requirement of PFA grant applications: “All projects propose ecological uplift to at least one or more of the HCP Covered Species”
  - [Appendix B Proposed Comprehensive HCP Covered Species List.pdf](#)

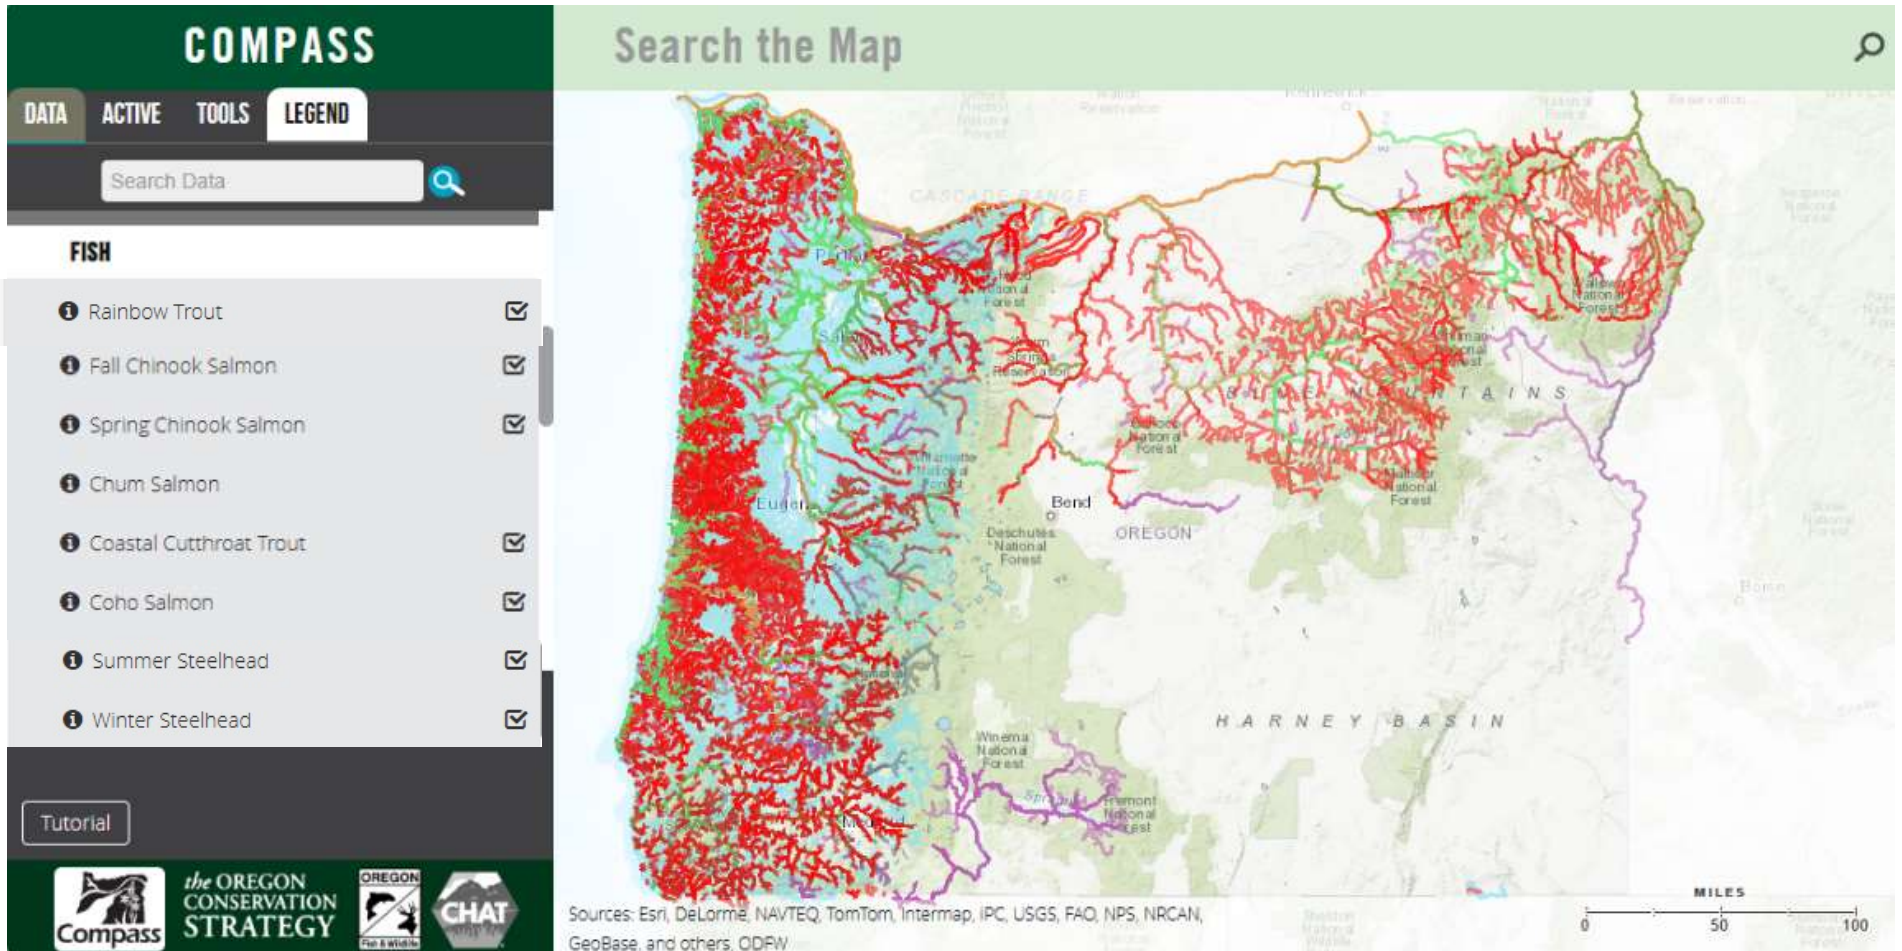

# Oregon HCP Species Impacted by 6PPD-Q

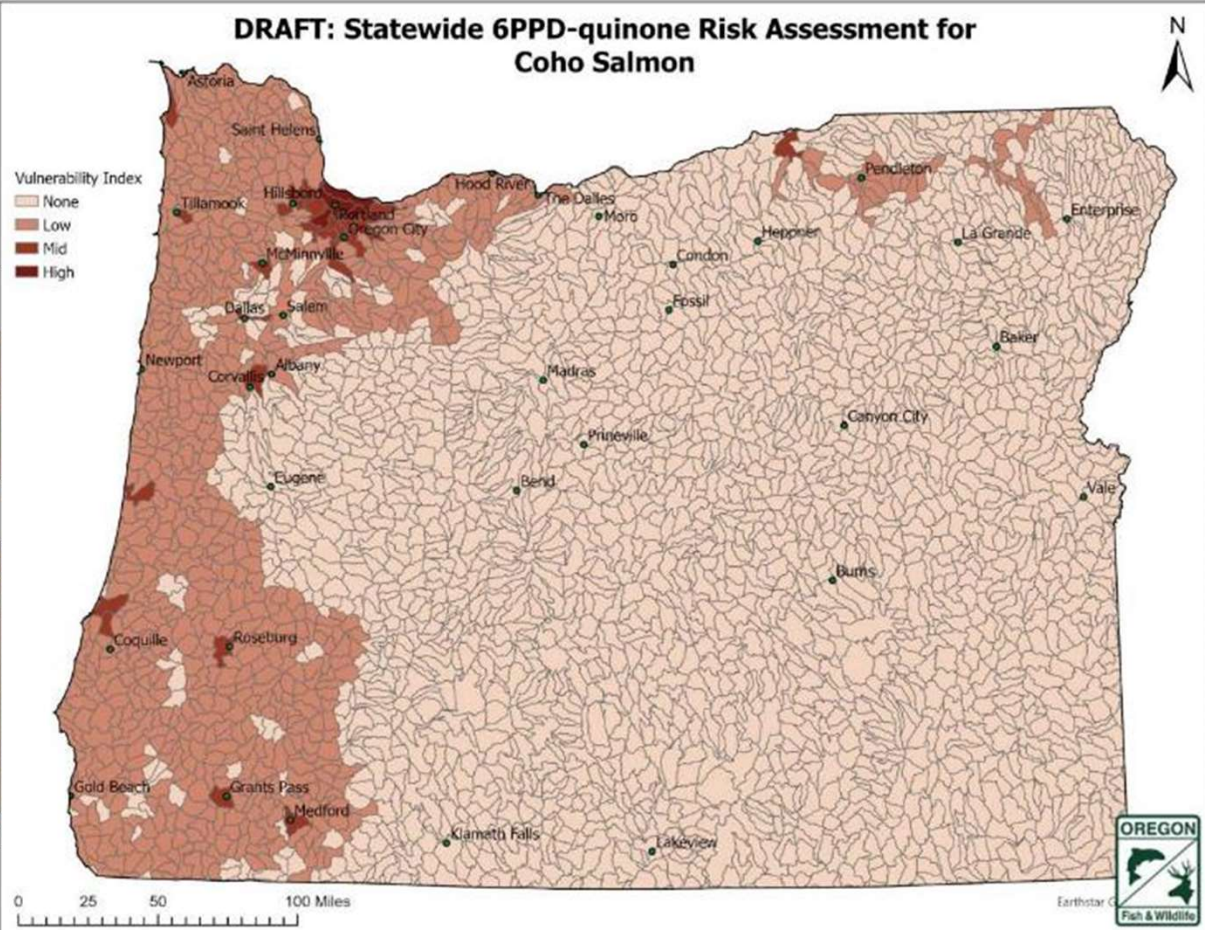

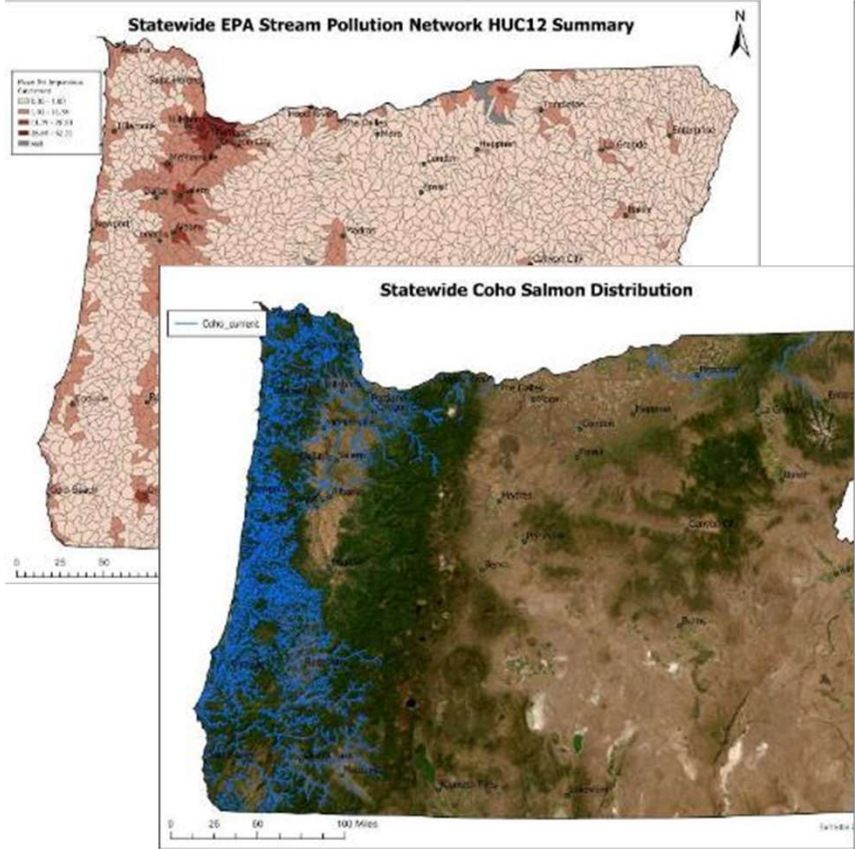

- Coho salmon
- Coastal cutthroat trout
- Steelhead/rainbow trout
- Chinook salmon

# Distribution of Species

# ODFW Coho Vulnerability Assessment

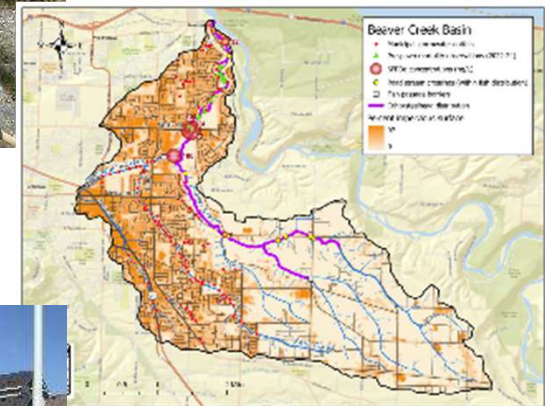

### 3. Implications for PFA Grantees

- Mitigation of 6PPD-q can be eligible under the PFA Grants Program if tied to conservation benefits for HCP species

# Project Type Examples

- Monitoring and data collection
  - e.g. 6PPD-Q testing in the field, spawning surveys
- Mapping and prioritization
  - e.g. Collecting and analyzing GIS data to understand where the issues are and where treatment is most needed
- Mitigation
  - e.g. designing and constructing stormwater treatment for 6PPD-Q

# Mitigation Project Type Examples

- Outfall treatment
  - Bioretention
  - Filter cartridge vaults
- Roadside treatment
  - Swales
  - Planters
  - Tree wells
- Treatment with pavement
  - Full-depth porous for infiltration
  - Friction course for filtration

# Follow Up for More Information

- Contact us with ideas and questions:
  - Roy Iwai – [Roy.Iwai@MultCo.us](mailto:Roy.Iwai@MultCo.us)
  - Katie Holzer – [Katie.Holzer@GreshamOregon.gov](mailto:Katie.Holzer@GreshamOregon.gov)
  - Neil Schulman – [Neil@NCWatersheds.org](mailto:Neil@NCWatersheds.org)
- Join Oregon 6PPD-Q Workgroup meetings
  - Virtual meetings 3<sup>rd</sup> Thursday of the month, 1-3pm
  - Email Roy to get on list for email invite
  - <https://www.tryoncreek.org/6ppd-q/>
